

# EbE Vertexing for Mixing

Alex

For the LBLB group

# Decay $L_{xy}$ Determination

A 3 step process:

1. Determine vertex from tracks in the event (~25 $\mu\text{m}$ -ish)
2. Apply beamline constraint (~25 $\mu\text{m}$ -ish)
3. Compute secondary vertex position

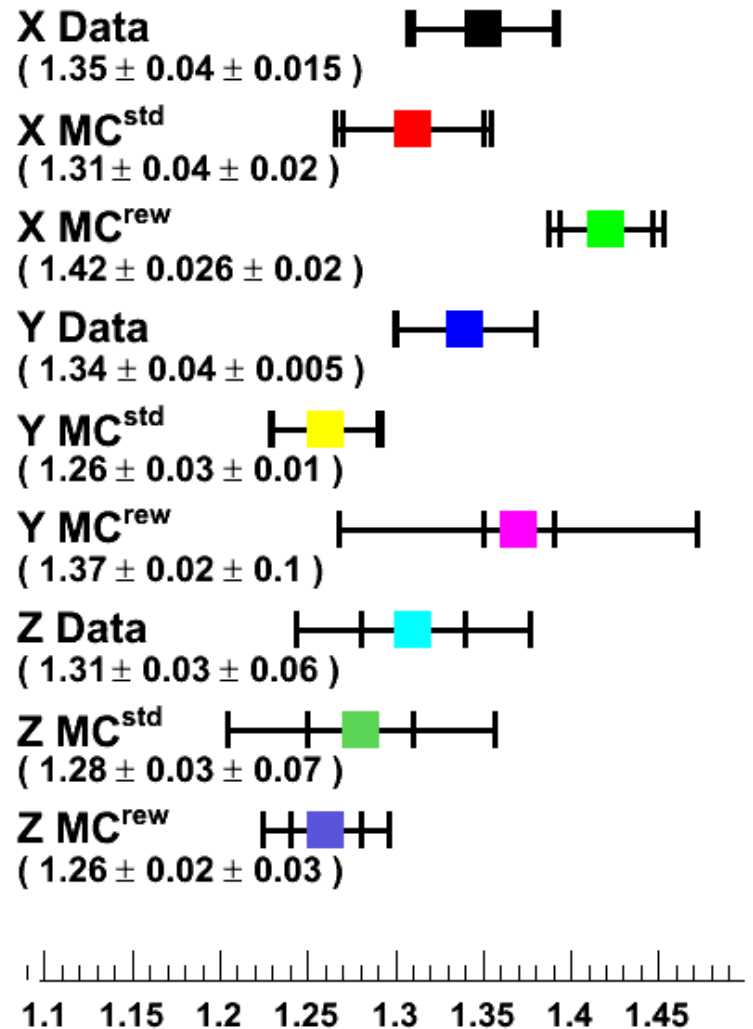

At each step, pulls of the new ingredient must be 1!!!

# PV Scale Factor (no beam constr.)

- Scale factor in data is  $O(1.38)$
- Montecarlo after L00 reweighting shows consistent numbers
- Systematics from fit model and across samples available [effect is  $O(10\%)$ ]
- Pull **after** beamline constraint?
  - Apply beam constraint
  - Look at d0 of fully reco'd candidates WRT EbE vertex
  - Affected by:
    - EbE (PV + beam)
    - Secondary Vertex

$B \rightarrow J/\psi K^+ V1-V2$  Pull

# Beamline Constraint

B IP pull [ width  $\pm$  stat  $\pm$  syst ] wrt EbE (full squares) or Beamline (empty circles)

Impact Parameter Pull  
w.r.t. beamline/beamline  
constrained EbE:

- $d_0^{\text{beam}}$  shows ~10-15% deviation from 1
- $d_0^{\text{EbE}}$  Shows O(20%) deviation

• Where do these come from?

1. Beamline [constraint]

2. Secondary Vertex res.

# Secondary Vertex Scale factor from B decays

Example:  $B \rightarrow \psi K^+$

- Fit  $\psi$  to a single vertex
- "point"  $\psi$  back to K
- Measure  $L_{xy}$  wrt B vertex
- Pull is a proxy for a "secondary vertex" pull!

# The SV scale factor problem

$B \rightarrow D L_{xy}$  pull [ width  $\pm$  stat  $\pm$  syst ]

$B \rightarrow J/\psi K^+$    
( 1.21  $\pm$  0.02  $\pm$  0.02 )

$B \rightarrow J/\psi K^*$    
( 1.11  $\pm$  0.03  $\pm$  0.02 )

$D^+ \rightarrow K\pi\pi$    
( 1.117  $\pm$  0.005  $\pm$  0.02 )

$\psi' \rightarrow J/\psi\pi\pi$    
( 0.98  $\pm$  0.015  $\pm$  0.01 )

- Re-analyzed all samples
- Fixed a couple of bugs...
- Pull grows as a function of lifetime?
- No clear dependency on any other variable spotted
- How does this compare to montecarlo?

# Montecarlo

We compare/complement data with:

- Toy montecarlo to study pull of fixed kinematics vs  $L_{xy}$

- Several samples:

- As many of the modes we study on data as possible

- $\psi, \psi K^+, \psi K^*, D^+$

- Pythia (preferable to evaluate the PV pulls)

- Bgen (suitable for most SV studies)

# L00 Reweighting on SV

- L00 reweighting has a larger effect on SV than PV

- Effect consistently reproduces our 'problem' on Montecarlo!!!

- If we find consistency with data, we can dissect the MC and get another tool to investigate the problem!

- In the short term we can just use MC to assess the scale factor, with a systematic uncertainty of few %!

- We can confirm this looking at the impact parameter, rather than  $L_{xy}$

$B \rightarrow D L_{xy}$  pull [ width  $\pm$  stat  $\pm$  syst ]

$B \rightarrow J/\psi K^+$   
( 1.21  $\pm$  0.02  $\pm$  0.02 )

MC<sup>reweight</sup>  $B \rightarrow J/\psi K^+$   
( 1.22  $\pm$  0.02  $\pm$  0.04 )

$B \rightarrow J/\psi K^*$   
( 1.11  $\pm$  0.03  $\pm$  0.02 )

MC<sup>reweight</sup>  $B \rightarrow J/\psi K^*$   
( 1.05  $\pm$  0.03  $\pm$  0.04 )

$D^+ \rightarrow K\pi\pi$   
( 1.117  $\pm$  0.005  $\pm$  0.02 )

MC<sup>rew. prompt</sup>  $D^+ \rightarrow K\pi\pi$   
( 1.14  $\pm$  0.002  $\pm$  0.03 )

$\psi' \rightarrow J/\psi\pi\pi$   
( 0.98  $\pm$  0.015  $\pm$  0.01 )

MC<sup>reweight</sup>  $\psi' \rightarrow J/\psi\pi\pi$   
( 1.03  $\pm$  0.05  $\pm$  0.02 )

# Cross check: 'B' pion IP

B pion  $d_0$  WRT D vertex pull [ width  $\pm$  stat  $\pm$  syst ]

Picture is consistent with what we see on  $L_{xy}$  !!!

# Bottomline

- SV scale factor **depends** on mode (kinematics/topology)
- Montecarlo **reproduces** the behavior
- We can measure the appropriate scale factor comparing **measured-truth**

# Conclusions

- We now have a way of assessing all the scale factors involved [ $O(10-20\%)$  different from 1]
- Aart's measurement of the beamline 'growth' with time needs to be incorporated as well [ $O(10-15\%)$  effect]
- Putting all together should allow us to obtain a consistent picture with a reasonable systematic [ $O(10\%)$ ]
- Plan is to verify this and document everything!
