

Gflash Lateral Shower Profile Tuning

Pedro A. Movilla Fernández (LBNL)

Simulation Group Meeting Sep 8th, 2005

Overview

- Preliminary results for tuning of the hadronic lateral shower profile:
 - central calorimeter
 - track momentum range 0.5-24.0 GeV/c
 - parametrization in Gflash: see gfinha.F, gfshow.F
- Single particle response dependence on data/MC type:
 - data: JET_CALIB, Minbias
 - MC: FakeEv, PYTHIA Minbias (current tuning)
- Tuning samples:
 - data: JET_CALIB (gjtc0d), 16 M events
 - MC: FakeEv, 1 track/event, flat spectrum,
 $\pi^{\pm}/K^{\pm}/(p,\bar{p})=60\%/30\%/10\%$, weighted with data spectrum

Track Selection

Quality cuts

- $N_{\text{vtx}} = 1$
- $|z_{\text{vtx}}| < 6\text{cm}$, $|z_0| < 6\text{cm}$ ($0 < p < 8\text{ GeV/c}$)
- $|z_{\text{vtx}}| < 60\text{cm}$, $|z_0| < 60\text{cm}$ ($8 < p < 24\text{ GeV/c}$)
- 7x7 isolation
- CES isolation

Number of hits

COT		Silicon	
ax	st	ax	
30	30	-	tower 1-8
25	25	-	tower 9
20	20	4	tower 10-11

tower number	momentum range (GeV/c)								
	≥ 2	0.5-2	2-3	3-5	5-8	8-12	12-16	16-24	> 24
0	101906	329537	11846	64676	16578	8015	629	116	45
1	109072	345385	12726	68439	17704	9262	754	147	39
2	114259	359959	13951	69419	18595	11170	914	169	41
3	115352	365974	15181	65847	19720	13125	1195	245	37

10	78510	501283	52699	21349	3754	570	94	32	8
11	121194	552756	78114	34826	6926	1050	195	65	13

used for tuning

- plus contour cut for lateral profile:
require track within inner 0.6x0.6 of target tower

gjtc0d

Track Spectra (Central)

track p (cut) (central)

track p (cut) (central)

track p (cut) (central)

- w/o reweighting discrepancies between data samples around JET_CALIB trigger thresholds 4, 7 GeV/c expected

Cross Check of Data Samples (1)

FakeEv / gjtc0d

- Remember: Gen-5 JES uncertainty for $p < 12 \text{ GeV}/c$ claimed to be 2%.
- FakeEv does not follow the structure in the data around 6 GeV.

gjtc0d / gjtc01 / gmbs0d

- JET_CALIB: gjtc0d (16M), gjtc01 (1.3M)
- Minbias: gmbs0d (13M of 21M)
- suffer from too low single track statistics at $p > 6 \text{ GeV}/c$
- Reasonable agreement within statistical uncertainties. Structure in gjtc0d around 6 GeV/c “consistent” with other data samples.

Cross Check of Data Samples, Central (2)

Unweighted lateral profiles:

0.5-2.0 GeV/c

EM/p by η (cor, $0.5 \leq p < 2.0$): central

HAD/p by η (cor, $0.5 \leq p < 2.0$): central

TOT/p by η (cor, $0.5 \leq p < 2.0$): central

2.0-3.0 GeV/c

EM/p by η (cor, $2.0 \leq p < 3.0$): central

HAD/p by η (cor, $2.0 \leq p < 3.0$): central

TOT/p by η (cor, $2.0 \leq p < 3.0$): central

Cross Check of Data Samples, Central (2)

5.0-8.0 GeV/c

EM/p by η (cor, $5.0 \leq p < 8.0$): central

HAD/p by η (cor, $5.0 \leq p < 8.0$): central

TOT/p by η (cor, $5.0 \leq p < 8.0$): central

NB: trigger thresholds

8.0-12.0 GeV/c

EM/p by η (cor, $8.0 \leq p < 12.0$): central

HAD/p by η (cor, $8.0 \leq p < 12.0$): central

TOT/p by η (cor, $8.0 \leq p < 12.0$): central

Cross Check of MC Samples, Central

FakeEv(weighted) / Pythia Minbias (pydj000)

- Reasonable consistency within statistical uncertainties.
- FakeEv somewhat better than Pythia MB (probably due to reweighting).
- PYTHIA Minbias sample suffer from too low statistics at $p > 6 \text{ GeV/c}$.

Cross Check of MC Samples, Central (2)

Cross Check of MC Samples, Central (3)

EM/p by η (cor, $5.0 \leq p < 8.0$): central

HAD/p by η

5.0-8.0 GeV/c

TOT/p by η (cor, $5.0 \leq p < 8.0$): central

old tune!

or, $8.0 \leq p < 12.0$: central

HAD/p by η

8.0-12.0 GeV/c

TOT/p by η (cor, $8.0 \leq p < 12.0$): central

Lateral Profile Tuning Results

Hadronic lateral profile

$$f(r) = \frac{2 r R_0^2}{(r^2 + R_0^2)^2} \quad \langle R_0(E, x) \rangle = R_1 + Q x$$

$$Q = R_2 - R_3 \log p$$

- Cutoffs used: $R_0^{\max} < 1.4$, $x^{\max} < 2.0$
- Shower core $R_1(\text{HAD})$ at $p < 2.5$ GeV/c consistent with old tune.
- EM and HAD give different optimal R_1 values for $p < 5$ GeV/c.
 - Shower extrapolation effects?
 - Cutoff artefacts?
- Consistent picture at higher momenta.
- Need to “combine” green and red curve reasonably.
- Subdominant spread term $Q(p)$ is very weakly constrained: moderate shift of R_1 to higher values necessary to extract some p dependence.

(R1,Q)-Scans 2-3GeV/c

χ^2 (EM) 2.0-3.0 GeV/c

EM

HAD

χ^2 (HAD) 2.0-3.0 GeV/c

EM/p by η (cor, $2.0 \leq p < 3.0$): central (w) $\chi^2 = 13.0$

HAD/p by η (cor, $2.0 \leq p < 3.0$): central (w) $\chi^2 = 51.0$

(R1,Q)-Scans 3-5GeV/c

χ^2 (EM) 3.0-5.0 GeV/c

EM

HAD

χ^2 (HAD) 3.0-5.0 GeV/c

EM/p by η (cor, $3.0 \leq p < 5.0$): central (w) $\chi^2 = 195.6$

HAD/p by η (cor, $3.0 \leq p < 5.0$): central (w) $\chi^2 = 1618.0$

(R1,Q)-Scans 5-8GeV/c

χ^2 (EM) 5.0-8.0 GeV/c

EM

HAD

χ^2 (HAD) 5.0-8.0 GeV/c

EM/p by η (cor, $5.0 \leq p < 8.0$): central (w) $\chi^2 = 119.5$

HAD/p by η (cor, $5.0 \leq p < 8.0$): central (w) $\chi^2 = 254.0$

(R1,Q)-Scans 8-12GeV/c

χ^2 (EM) 8.0-12.0 GeV/c

EM

χ^2 (HAD) 8.0-12.0 GeV/c

HAD

EM/p by η (cor, $8.0 \leq p < 12.0$): central (w) $\chi^2 = 40.9$

HAD/p by η (cor, $8.0 \leq p < 12.0$): central (w) $\chi^2 = 13.1$

(R1,Q)-Scans 12-16GeV/c

χ^2 (EM) 12.0-16.0 GeV/c

EM

HAD

χ^2 (HAD) 12.0-16.0 GeV/c

EM/p by η (cor, 12.0 $\leq$ p<16.0): central (w) $\chi^2 = 5.7$

HAD/p by η (cor, 12.0 $\leq$ p<16.0): central (w) $\chi^2 = 3.9$

(R1,Q)-Scans 16-24GeV/c

χ^2 (EM) 16.0-24.0 GeV/c

EM

HAD

χ^2 (HAD) 16.0-24.0 GeV/c

EM/p by η (cor, 16.0 $\leq$ p < 24.0): central (w)

$\chi^2 = 0.5$

HAD/p by η (cor, 16.0 $\leq$ p < 24.0): central (w)

$\chi^2 = 0.1$

Conclusions

- Cross checked E/p responses (absolute, lateral) with different data and MC samples – expectedly no surprises.
- Second tuning iteration already gives improvement of simulated lateral profiles in the central part up to 20 GeV/c. Will provide a usable parametrization soon.
- Have to check impact of Gflash shower cutoffs on disagreement between EM and HAD results at low momentum.
- Will start plug tuning soon (same philosophy).
- Further refinements as we get new data from recent/ongoing single track trigger runs.
