

CDF/D0 Combined Upper Limit on Higgs Production

Wei-Ming Yao (LBNL) for TEVNPHWG Working Group

TEVNPHWG Meeting , 7/11/2006

What's New

- Fix the data histogram in D0: $WW \rightarrow \mu\mu$ at $m_H=150$ GeV/ c^2 from Wade
- Rerun the observed and expected limited
- Impact of systematic on the limits
- Reminder: A Bayesian framework is used to compute the upper limit with all 13 channels combined.

Individual and Combined Limits

Observed and Expected Limits

CDF/D0 Expected Limits from Pseudo-Experiments

Conclusion

- We obtain a combined Higgs limit from CDF/D0 using a Bayesian method.
- The returned limit for each individual channel seems reasonable after fixing D0: $WW \rightarrow \mu\mu$ problem.
- The combined limit and expectation of Pseudo-experiments are also consistent.
- The impact of systematic seems small in the CDF model because the correlations between signal and background are minimized.

BACKUP SLIDES

Likelihood Function

- $\mathcal{L}(R, \vec{s}, \vec{b} | \vec{n}) = \prod_{i=1}^{N_C} \prod_{j=1}^{N_{bins}} \frac{\mu_{ij}^{n_{ij}} \cdot e^{-\mu_{ij}}}{n_{ij}!}$
 - $R = \sigma \cdot B / SM$; $s = \sigma_i^{SM} \cdot B^{SM} \cdot \epsilon_{acc} \cdot L$.
 - $\vec{b}$: backgrounds
 - $\vec{n}$: data
 - N_C : channels
 - N_{bins} : histogram bins.
 - $\mu_{ij} = R \cdot s_{ij} + b_{ij}$.
- The expected signal event depends on:
luminosity, btag sf, lepton id, jes, ISR/FSR+PDF, and the rest uncertainties
- The background consists of:
HF, Mistag, top, non-W, diboson (WW), and other.

Priors, Posterior Densities and Upper Limit on R

- The priors for efficiencies and backgrounds are truncated Gaussian densities with its expected value within its uncertainty.

- Assign a flat prior to the number of Higgs events, instead of Higgs xsec.

$$\pi(R, \vec{s}, \vec{b}) = s_{tot} \cdot \theta(R \cdot s_{tot}) \cdot \pi(\vec{s}) \cdot \pi(\vec{b})$$

- Posterior density:

$$p(R|\vec{n}) = \frac{\int d\vec{s} \int d\vec{b} \mathcal{L}(R, \vec{s}, \vec{b}|\vec{n}) \cdot s_{tot}}{\int dR \int d\vec{s} \int d\vec{b} \mathcal{L}(R, \vec{s}, \vec{b}|\vec{n}) \cdot s_{tot}}$$

- 95% Upper Limit:

$$\int_0^{R_{0.95}} p(R|\vec{n}) dR = 0.95$$

Source of Correlated Systematic (CDF)				
Channels	$l\nu b\bar{b}_S$	$l\nu b\bar{b}_D$	$\nu\nu b\bar{b}$	W^+W^-
Luminosity (%)	6.0	6.0	6.0	6.0
btag SF(%)	5.3	16.0	6.3	0.
Lepton ID (%)	2.0	2.0	2.0	3.0
JES (%)	3.0	3.0	8.0	1.0
I(F)SR+PDF(%)	4.0	10.0	2.0	5.0
Trigger (%)	0.0	0.0	2.0	0.0
Backgrounds				
HF (%)	33.0	34.0	0.	0.
Mistag (%)	22.0	15.0	16.0	0.
Top (%)	13.5	20.0	18.0	0.0
QCD (%)	17.0	20.0	-34.0	0.
Diboson (%)	16	25	18	11
Others (%)	0.	0.	0.	-(12-18)

- The positive value means correlated, the negative value means uncorrelated
- The results seems insensitive to these correlations changing from 100% to 0%
- Common to D0: 4% on Luminosity; 8% on σ_t ; 6% on σ_{EW} ; 10% on $\sigma_{H\rightarrow WW}$
